Empty queues, reset ceilings
Env A
Drift towards $1.05\times$ share
Scale slices to fit B
Both
Observe each gNB's feature row
N requests, at most $4N$ pending
Accept or reject, move ceilings
Reward r_t of Eq. (1)
Unserved demand becomes backlog
Same, redraw load phase ψ_i
Env B
Load follows a 60-step sine
Budget shrinks with neighbour load
next step, $T{=}60$ per episode
